

## A detailed photograph of a longhorn beetle (Cerambycidae) with a light brown, textured body and long, segmented antennae, resting on a white surface. The beetle's body is covered in a fine, mottled pattern of darker brown spots. Its antennae are exceptionally long and thin, with a distinct segmentation. The beetle is positioned diagonally across the frame, with its head towards the bottom left and its abdomen towards the top right. The background is a plain, bright white surface, which makes the beetle's features stand out clearly.
